

Department of Instrumentation and Control Innovative Teaching Method 2020-21

Class:	BE
Name of Method:	Padlet
Subject:	Project Engineering and Management
Name of Staff	Dr. Ashwini K. Patil
Date and Time:	25/9/2020
No of students:	15
Learning Objective: <ol style="list-style-type: none"> 1. Students should be able to use the concept taught in simple application. 2. Confidence of the students should boost. 	
Outcomes: On completion students were able to <ol style="list-style-type: none"> 1. Think and answer the application-based questions 	
Description: In this method, the concept of Process and Instrument diagram was discussed with the students in lecture. Based on it, application-based questions thrown on padlet and ask every student to respond. The responses were visible to everybody, which helped them to see the thought process of each other.	
Impact of Innovative Method: In normal case when the questions are raised in class verbally, very few students respond. In this method most of the students thought on the questions and respond independently.	
Pos and PSOs: PO1, PO10, PSO1	

Dr. Ashwini K. Patil

Made with a taste for adventure

Jayashri Bhamare :

Diagram consists of LVDT.this is primary transducer, which is used to measure the force and displacement by associating a specific signal value for any given position of the core.

Bhavana Boraste - LVDT act as a secondary transducer.

Arjun ugale

working of a LVDT sensor

Rohit Malunjkar

The LVDT consist of 2 sec windings and 1 primary winding on either side of LVDT . The cord is pulling the core in this diagram . The sec windings have equal no. Of turns.

Lalit Badhan

The diagram shows that consist primary winding p and 2 secondary winding s1 s2 wound on a cylindrical former.

LVDT shows output voltage, coils(primary & secondary)

Tanmay Aher

Diagram consists of lvd where it also consists of primary and secondary winding keeping the lvd in middle and winding at opposite side of each other. It also shows that iron core move on s1 and s2 and due to which voltage will be change

Gawale kasturi Arvind

LVDT is type of transducer in the bourdon tube is coupled to the movable core and in this output voltage will changes according

Mrunal Patil

In this diagram , when the core makes displacement the tube moves which can be used to measure depth.

Nikhil kandare

LVDT consist of primary and secondary winding

Vaishnavi Bhavsar

This is the primary transducer . Used to measure the force or something .To provide displacement feedback

Prasad Bondarde :- the diagram show that the soft iron core is pull or move on the S1 and S2 and the LVDT output voltage will be change according

Atharav Aher

In the diagram the cod is pulling the core towards the output coli so it will measure the displace made by the pull of cord

Here the core will get moved by some external means and the LVDT sensor which is having secondary coils will indicate position or depth of core to up or

*****by measuring the voltage induced in the output coil**

It is LVDT type of transducer, which is a dourdon type is coupled to the movable core of Lvd in that output voltage will changes according

Nikhil kandare

Diagram showing that the

Made with whirlisys

Jayashri Bhamare:

When trolley will passes through light beam.computer connected to the light bridge will measure the speed and time interval.

Anushka Nikam

By measuring the length of the single mask in meters and the time taken to break the beam in seconds , the Instantaneous Speed at the bottom of the ramp can be found using the formula.

Vedant ugale

When the trolley travel through the light beam then the computer detect the speed . Then the interruption time interval get calculated by the computer which gives the speed of trolley

Pooja Dhage ..

When trolley travel on the ramp Speed is Over a very short time . And instantly measure the speed.

Ashwini Devkar

Measure the length of ramp.push trolley through the light beam.in computer timer measure the time & calculate the Instantaneous speed

When trolley travels on the ramp .speed is measured over a very short time .Instantly measure the speed.

Tanmay

In the given case the trolley will come sliding down, when it cut down the beam of light the speed can be find out and the time is calculated when the beam of light rejoins again without any obstacle

Aqsa Khan

Measure the length of the trolley at rest (m) and the time taken by light beam to break the light bridge (sec), the Instantaneous Speed at the ramp is measured by- Instantaneous speed (v) =distance(m)/time(s)

ADITYA TAMBADE -

When trolley pass from light beam then then computer will show the speed & measurement

Bhavana Boraste ..

Trolley will pass through some kinetic energy..

Vishal Yadav

When the Trolley travel through the ramp it having finite distance then it pass through the light beam then computer detect the speed of the Trolley by dividing the length of the ramp.

Gawale kasturi

This animation is shows that power will generated by electrical circuit

Pranav Kadam.

As trolley rotating down to the bottom of the light sensor, light sensor is control by computer, trolley pass through the light sensor

Onkar kapadne

trolley will pass through light bridge which is connected to computer which should have a photoelectric sensor, it will calculate the disturbance in light bridge and using that we can calculate speed of trolley.

Tejal Mali

By measuring the length of the single mask (in meter) and the time taken to break the beam (in second) the instantaneous speed at the bottom of the ramp can be found using the formula speed = Distance/Time

The animations is showed

that power will generated by electrical circuit

and light sensor measure instantaneous speed and send computer

trolley is moved some kinetic

Mrunal Patil

There is a sensor which will detect the light beam is passing which is connected to the computer. The light beam will break when the trolley will come. This signal will be given to the computer.

Ruban

The speed can be found out by calculating the time taken when the beam of light is broken until the beam of light connects back without any disturbance

And the trolley will pulled by some kinetic energy .

Bhakti M. Boob

When trolley will pass through light bridge which is connected to computer which should have a photoelectric sensor, it will calculate the time having disturbance in light bridge and using that we can calculate speed of trolley.

ATHARVA MORE

the trolley will come sliding down the ramp till the light source and the computer will measure the time for which the trolley travels on the ramp by measuring the distance between the trolley starting position and the ramp we will be able to calculate the instantaneous speed .

ROHIT MALUNJKAR

In this case the trolley will come sliding down the ramp till the light source . So the computer will measure the time for which the trolley travels on the ramp . And by measuring the distance between the trolley's initial position and the ramp we can calculate the instantaneous speed .

Lalit Badhan

Trolley will pass Light source and Light beam then computer Will measure .by How long Light bridge and light source then measure speed of trolley by calculating time .

Prasad Bondarde

When trolley pass from the light beam or light source the computer will be measure the interruption time interval get calculated by the computer which display or give the speed of trolley.

Gaurav Sharma

When the trolley will do the 'to and fro' motion i.e it will pass through the rays of light sensor then the computer will count the no.s of motion of the trolley. And it will give us speed rate of trolley.

Akanksha Pawar

When trolley will start moving down and when first single mask will cut the light beam start measuring time upto when second single mask of trolley cut the light beam.

VIKRANT THORAT

As trolley will pass between light source and receiver Computer will measure by How long there is disruption between source and receiver and

Nikhil kandare

When the vehicle pass through the light beam we can set there vehicle speed sensor (vss) it's type of tachometer and we connect that sensors to the computer and after the vehicle passes speed will be measured by detecting the vehicle speed by sensors...and result will
